

ECI (EN-3212)- Electronics (& Computer Integration)

Electronics - Fall 2012

ECI provides a broad overview of the modern electronics used by the marine and power industries for automation, system monitoring and control. Electronic components and circuits are categorized by function (sensor, transmitter, actuator or controller), signal type (analog or digital), and technology (i.e., computer, micro-electronic, solid-state).

Learning Outcomes:

1. Understand the relationship of component blocks and signals in electronic systems.
2. Define primary circuits and components used for analog signals and conditioning.
3. Define primary circuits and components used for digital signals and conditioning.
4. Read analog and digital circuit diagrams, and identify basic electronic components.
5. Understand the use of solid-state devices for amplification and switching applications.
6. Read and understand PLC and ladder logic circuits used in discrete-state applications.

Text: **Process Control Instrumentation Technology**
Curtis D. Johnson, 8th Edition (© 2006), Prentice Hall

Instructor: Dr. John J. Bausch Phone: (508) 830-5000 (x-2029)
Email: jbausch@maritime.edu Room: HA 222
Home Office (Thurs): use email (or Skype if needed)

Calendar: Subscribe within Calendar Software (iCal on Macs, Outlook, and Google):
(check you email for setup inst)

Class: Monday, Wednesday, and Friday
Section 11- 0800 to 0850 Hours (1st period)
Room: BR 222 (see my ELab Hours for extra help)

Grading: Grades are based on homework, quizzes, and exams. The 2-hour final is comprehensive. Assignments are made via email. **Late work will NOT be accepted.**

Evaluation: Exam problems are based primarily on homework and quizzes.

Homework (~weekly)	10%
Quizzes (any time)	20%
Exam1	20%
Exam2	20%
<u>Final (2 hour Comprehensive)</u>	<u>30%</u>
Total Grade	100%

ECI (EN-3212)- Electronics & Computer Integration

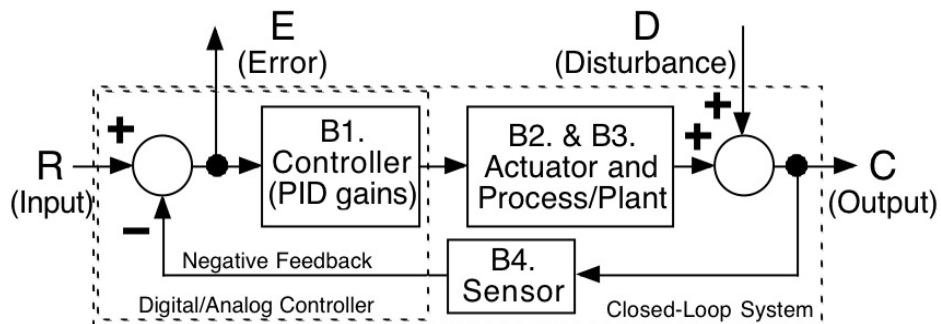

ECI now uses the textbook previously used for Instrumentation & Control: Curtis Johnson's "Process Control Instrumentation Technology". Using the first eight chapters, students are exposed to most of the electronic hardware components and systems in use in both analog and digital worlds. The open-loop diagram below is used to introduce students to the concept of a system, and the input/ output relationships of most industrial electronic components. Electronic hardware components are then defined as part of a 1) Controller, 2) an Actuator, or 3) a Sensor, and related to a process or application.

ECI-Electronics: The Open-Loop Block Diagram defines the major components of Electronic Hardware studied, and the relationship of signals and signal processing.

INC (EN-4223)- Instrumentation & Controls

Modern digital controllers require more advanced models and systems; real-time signals are integrated through programs like Matlab/Simulink (introduced in INC) using C-language-like .m files. The INC class takes the component block diagram from ECI (shown above), and adds the complexity of a closed-loop, multi-input, multi-output, PID controller (shown below). In this case, the system dynamics are essential to design, and the INC class introduces controller performance parameters based on 1) Stability, 2) Speed of Response, and 3) Dynamic Accuracy.

INC-Controls: The Closed-loop Block Diagram for Instrumentation & Controls. INC uses transfer functions to study the more advanced concepts of dynamic modeling and multi-input, multi-output, proportional-integral-derivative (PID) control systems.

ECI-SAMPLE- See the iCal Link (class email)

NOTE: This is Not the ACTUAL Syllabus. Check your email for the iCal Link to the online schedule. The online schedule is regularly updated for this Semester.

- L1: Welcome to ECI
- L2: Intro to Marine Electronics
- L3: Electronic Control Applications
- L4: Intro to Control Systems
- L5: Control System Performance
- L6: Digital & Analog Systems
- L7: Levels of Control Electronics
- L8: Measurement Units & Error
- L9: Error, Accuracy & Uncertainty
- L10: Sensors & System Dynamics
- L11: Intro to Analog Signal Processing
- L12: Filtering & Impedance
- L13: Voltage Dividers & Bridges
- L14: RC (Analog) Filters
- L15: RC Filter Design
- L16: Exam1 Review
- L17: 1st Order & 2nd Order Hi-Pass Filters
- L18: Advanced RC Filter Design
- L19: Filter Design with Op-Amps
- L20: Intro to Operational Amplifiers
- L21: Op-Amp Electronic Circuits
- L22: Intro to Digital Signal Processing
- L23: Boolean Algebra & Logic Gates
- L24: Digital PLCs (Programmable Logic Controllers)
- L25: Digital Electronics & Devices
- L26: Digital to Analog Converters (DACs)
- L27: Analog to Digital Converters (ADCs)
- L28: Exam2 Review
- L29: Guest Lecture: Mr. Tom Quinn from Rolls Royce Marine
- L30: Intro to Ladder Logic & PLC Systems
- L31: Switching Theory & Boolean Logic
- L32: Ladder Logic System Design
- L33: E-M Relay Timer Design
- L34: Cargo Elevator Application Case Study
- L35: Intro to Industrial PLCs
- L36: PLC Programming
- L37: Transistors & Solid-State Relays
- L38: ECI Course Review
- L39: Final Exam

Problem Set #1:

ECI- PSet1 Due Friday, 14Sep12

Reading: Chapter 1 in Johnson (Sections 1.1-1.4)

Problems:

1.1- A/C System, Block Diagram

1.2- Auto Driving Control

Is this open-loop or closed-loop?

What are the sensors?

1.3- Refer Madness. Chill out with another Block Diagram.

1.4- Control Performance Criteria: Max Error and Settling Time

1.5- System Tuning

1.6- Quarter Amplitude Criterion

1.7- Quarter Amplitude Criterion again
